Supplemental Table ST2. Genomic DNA input concentrations, total DNA input, and PCR amplification cycles used for Illumina library preparation. The table summarizes the amount of genomic DNA available from each sample prior to library preparation, the DNA input used for sequencing library construction, and the number of PCR amplification cycles applied. These data are provided to document sample-to-sample variation in starting DNA quantity and amplification requirements and to facilitate interpretation of differences in sequencing read recovery among samples.

Sample Name	Location name as shown in Table 1	Filter type	Sample Code	DNA [ng/µL]	PCR Cycles	Library Conc.	0.25ng eqv (5µL max)	15ng eqv	Number of reads

BDL: Below Detection Limit

High pool was diluted from 7.9 ng/µL to 1.8 ng/µL

Low pool was 0.13 ng/µL

Pools were combined at a 1:9 ratio (low:high), with a final pooled concentration of 0.78 ng/µL to be sequenced.
